The protein improves the moisturizing/softening action of the compositions. The protein, and its fragments are used in cosmetic or dermatological compositions. These compositions have use as hair or skin care products; and make-up or sunscreens. As the protein is a good, persistent film-formers on the skin of low surface density, it can be used for delivery of active agents that are generally difficult to administer, e.g. vitamins, hormones, moisturizers or agents for treating disorders of the skin and hair.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          108

                                                                                                                                                                                                                                                                                                                                The present sequence represents a spider silk protein from the present invention. Spider silk proteins, and peptide fragments within the proteins, can be produced and purified independently and can then be mixed and made into fibres that have higher tensile strengths and elasticity than naturally occurring fibres. The fibres can be used in mixed composites. The invention allows the two naturally occurring Nephila clavipes silk proteins to be produced independently so that they can later be combined to form silk fibres of high tensile strength
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     AAW53346 standard; Protein; 718

The invention provides isolated cDNA molecules coding for spider silk proteins. The spider silk proteins are characterized by repeating alpha and beta regions and optional variable regions. The DNA sequences are useful in the production of spider silk protein by recombinant DNA techniques. The recombinant spider silk proteins may be used for the

The repeat itself contains 3 regions. The first comprises 0-9 amino acids with a sequence AGR(GGX)2. This region is not highly conserved. The second region has a sequence GAG(A)x which is highly conserved and is 8-10 amino acids long. The third segment is (GGX)5 and is 15 amino acids long and is very highly conserved. In most cases X is A,Q, Y or L. Removal of the poly-(Ala) segments results
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           DNA encoding spider silk protein-1 and 2 and variants - isolated from Nephila clavipes, for prodn. of spider silk protein and fibres having desired characteristics

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         밁
This sequence represents a synthetic spider dragline variant polymer, CC Dp-1A.9. The sequence of the Dp-1A.9 monomer is given in AAR99052. CC The polypeptide monomer is a variant based on a consensus sequence cd derived from the fibre forming regions of spider dragline protein, CC esp. the natural protein 1 (Spidroin 1) from Nephila clavipes. CC DNA sequence encoding the monomer may be used in the recombinant CC production of the variant protein in a recombinant bost, e.g. E. coli CC or Bacillus subtilis. Synthetic analogues of Dp1 were designed to mimic CC of variation among individual repeats. Dp-1A analogues are composed CC of a tandemly repeated 101 amino acid monomer which comprises four repeats which differ from the consensus sequence given in AAW05201, CC residues; (1)-(5) given below. This 101 amino acid monomer is repeated 1-16 times in a series of analogue proteins. The individual repeats of analogue proteins. The conditional repeats differ from the consensus according to the pattern: (2) when the entire poly-alanine sequence is deleted, conditions is the surrounding sequence encompassing AGRGGIGGOGAGANGG: (3) aside from the poly-alanine sequence, deletions usually
                                                                                                                                                                                                                                                                                                                                                  etc., also related DNA, vectors and transformed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      DP-1A

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           encompass integral multiples of three consecutive residues;
(4) deletion of GYG is generally accompanied by deletion of the same sequence; and
in the same sequence; and
(5) a repeat in which the entire poly-alanine sequence is deleted is generally preceded by a repeat containing six alanine

The protein improves the moisturizing/ softening action of the compositions. The protein, and its fragments are used in cosmetic or dermatological compositions. These compositions have use as hair or skin care products; and make-up or sunscreens. As the protein is a good, persistent film-formers on the skin of low surface density, it can be used for delivery of active agents that are generally difficult to administer, e.g. vitamins,

                  A process has been developed for the production of a DNA fragment encoding silk protein. The process involves: (a) selecting target DNA, from a silk-producing spider, that contains many repetitive and non-repetitive regions; (b) selecting a single-stranded DNA primer of at least 10 nucleotides with a sequence that is complementary to a region of the target; (c) repetitively combining the primer with melted target DNA, incubating the mixture with nucleotides and a DNA polymerase with
                                                                                                                                                                               New opt. multimerised DNA sequences encoding spider silk protein contg. both repetitive and non-repetitive sequences, useful for making high strength films, fibres, woven articles etc.

The present sequence encodes the spider silk protein from Nephila clavipes. The DNA fragment can be used to make fibres, films, woven articles, e.g. for use in parachites, sails, body armour, and absorbers (e.g. of heavy metals, biological weapons, DNA, chemicals, flavours and fragrances). The high molecular weight (90-250 kD) of spider silk proteins can be produced on a commercial scale (at over 2 g/l cell mass). It has better tensile strength and elasticity than silkworm silk. Inclusion of both repetitive
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    and non-repetitive regions ensures isolation of stable clones.

                                                                                                                                  В
                                                                                                                                                                      S
                                                                                                                                                                                                                                                                                                                                               CC The polypeptide monomer is a variant based on a consensus sequence CC derived from the fibre forming regions of spider dragline protein, CC esp. the natural protein 1 (Spidroin 1) from Nephila clavipes. The CC DNA sequence encoding the monomer may be used in the recombinant CC production of the variant protein in a recombinant host, e.g. E. coli CC or Bacillus subtilis. Synthetic analogues of DP1 were designed to mimic CC the repeating consensus sequence of the natural protein and the pattern CC of variation among individual repeats. This monomer exhibits all of the CC regularities of (1)-(5) below. In addition, it exhibits a regularity of CC the natural sequence which is not shared by DP-1A, namely that a repeat CC in which both GYG and GRC are deleted is generally preceded by a repeat CC in which both GYG and GRC are deleted is generally preceded by a repeat CC a more extended segment than does DP-1A. The individual repeats differ CC a more extended segment than does DP-1A. The individual repeats differ CC (1) the poly-alanine sequence varies in length from 0-7 CC (1) the poly-alanine sequence varies in length from 0-7 CC (1) saide from the poly-alanine sequence varies in length from 0-7 CC (3) aside from the poly-alanine sequence, deletions usually CC (3) aside from the poly-alanine sequence, deletions usually CC (4) deletion of GYG is generally accompanied by deletion of GRG CC in the same sequence; and (5) a repeat in which the entire poly-alanine sequence is decended to the same sequence; and (5) a repeat in which the entire poly-alanine sequence is consecutive residues; (6) a repeat in which the entire poly-alanine sequence is consecutive is deletion of GRG CC deleted is generally preceded by a repeat containing six alanine sequence is consecutive residues.
                                                                                                                                                                                                                                  Matches 462;

The protein improves the moisturizing/ softening action of the compositions. The protein, and its fragments are used in cosmetic or dermatological compositions. These compositions have use as hair or skin care products; and make up or sunscreens. As the protein is a good, persistent film-formers on the skin of low surface density, it can be used for delivery of active agents that are generally difficult to administer, e.g. vitamins, hormones, moisturizers or agents for treating disorders of the skin and hair.

                                                                                                                                                                                                                                                                                                      CC DP-1B.16. The sequence of the DP-1B.16 monomer is given in AAR99056.
CC DP-1B.16. The sequence of the DP-1B.16 monomer is given in AAR99056.
CC The polypeptide monomer is a variant based on a consensus sequence
CC derived from the fibre forming regions of spider dragline protein,
CC esp. the natural protein 1 (Spidroin 1) from Nephila clavipes. The
CDNA sequence encoding the monomer may be used in the recombinant
CC or Bacillus subtilis. Synthetic analogues of DPI were designed to mimic
CC or Tacillus subtilis. Synthetic analogues of DPI were designed to mimic
CC or Tacillus subtilis. Synthetic analogues of DPI were designed to mimic
CC or Tacillus subtilis. This monomer exhibits all of the
CC regularities of (1)-(5) below. In addition, it exhibits a regularity of
CC regularities of (1)-(5) below. In addition, it exhibits a regularity of
CC the natural sequence which is not shared by DP-1A, namely that a repeat
CC in which both GYG and GRG are deleted is generally preceded by a repeat
CC taking the entire poly-alanine repeat, with one intervening repeat.
CC The sequence of DP-1B matches the natural sequence more closely over
CC a more extended segment than does DP-1A. The individual repeats differ
CC from the consensus sequence given in AAM06201 according to the pattern:
CC from the consensus sequence varies in length from 0-7
CC residues; (2) when the entire poly-alanine sequence is deleted,
CC so also is the surrounding sequence more, deletions usually
CC encompass integral multiples of three consecutive residues;
CC in the same sequence, and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Spider; aray-
fibre forming region, -
fibre;
                                                                                                                                                                                                        in the same sequence; and (5) a repeat in which deleted is generally preceded
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New synthetic variants of spider dragline protein - for making fibres useful as clothing, surgical silk, plastic reinforcement etc., also related DNA, vectors and transformed cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 AAR99057 standard; Protein; 604 AA.

The protein improves the moisturizing/softening action of the compositions. The protein, and its fragments are used in cosmetic or dermatological compositions. These compositions have use as hair or skin care products; and make-up or sunscreens. As the protein is a good, persistent film-formers on the skin of low surface density, it can be used for delivery of active agents that are generally difficult to administer, e.g. vitamins, hormones, moisturizers or agents for treating disorders of the

Repeat unit peptides of MiSP1 may form part of a larger polypeptide with an amino terminus (see AAR80184-85) and a carboxy terminus (see AAR80186-89). Repeat unit peptides make up spider silk proteins (spidroins) which in turn aggregate to form the silk fibres have high tensile strength and significant elasticity. An isolated cDNA clone of a silk protein encoding sequence is of use to produce the protein at high yields
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Polypeptide(s) comprising repeated unit amino acid sequences, cDNAs - derived from minor ampullate spider silk proteins and to form spider silk fibres
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     pMISS1 MiSP spider silk protein insert product.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           01-MAY-1996

The protein improves the moisturizing/softening action of the compositions. The protein, and its fragments are used in cosmetic or dermatological compositions. These compositions have use as hair or skin care products; and make up or sunscreens. As the protein is a good, persistent fillm-formers on the skin of low surface density, it can be used for delivery of active agents that are generally difficult to administer, e.g. vitamins, because the protein is a good, persistent film to administer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Claim

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 밁
                                                                                                                                                                                                                                                                differ from the consensus repeat sequence by deletions of integral multiples of five consecutive amino acids consisting of the pentapeptide sequences GPGGY or GPGQQ. Synthetic analogues of DP2 were designed to mimic the repeating consensus sequence of the natural protein and the pattern of variation among individual repeats. The analogue DP-2A is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This sequence represents a synthetic spider dragline variant pol DP-2A. The sequence of the DP-2A monomer is given in AAR99058. DP-2A. The sequence and is rich in Gly and Ala. It is unl DP-1 except for the region of consecutive Ala residues. The representation of the protein and the pattern of variation lead to the production of the consensus sequence given in AAR99085. The ind repeats differ from the consensus sequence according to a patter
                                                          composed of tandemly repeated 119-amino acid peptide monomers which comprises three repeats which differ according to (1)-(2) above. This 119 amino acid monomer is repeated 1-16 times in the DP2 analogues. The proteins may be used to produce fibres of high tensile strength and elasticity, suitable for clothing, rope, surgical sutures, biomaterials for implants, plastic reinforcements, films, coatings, etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Spider; dragline protein; variant; monomer; polymer; fibre forming region; Spidroin 1; Nephila clavipes; DP1; mimi DP-1A analogue; fibre; high tensile strength; elasticity; clo rope; surgical suture; implant; reinforcement; film; coating.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New synthetic variants of spider dragline protein - for making fibres useful as clothing, surgical silk, plastic reinforcement etc., also related DNA, vectors and transformed cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Synthetic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              17-JAN-1997
